S. M. BEMISS, M.D.

EXTRACTED FROM THE
TRANSACTIONS OF THE AMERICAN MEDICAL ASSOCIATION.

PHILADELPHIA:
COLLINS, PRINTER, 705 LODGE ALLEY.
1858.

REPORT.

Is the offspring of marriages of consanguinity equal physically and mentally to the offspring of parents not connected by ties of blood—both classes being supposed to be similarly circumstanced in respect to all other causes affecting the integrity of their issue?

A question of similar import to this has at times engaged popular attention probably for many ages, and yet no facts have hitherto been collected of sufficient number and authenticity to determine its solution. This neglect to accumulate statistical testimony as to the results of family intermarriage could not have proceeded from paucity of material, since, not only do the pages of history teem with instances of such marriage, but they are found in almost every social circle, and should receive the earnest scrutiny of physiologists. Surely, no questions can concern us more closely than those which relate to the prevention of the numerous congenital abnormalities of our species, among the causes of which, intermarriage of members of the same family blood may appear not the least important.

Passing allusions to the evil consequences of marriages of consanguinity may be found in a number of authors, but the subject has not been made a point of special inquiry, so far as I have been able to learn, except by Rev. Charles Brooks in a lecture before the American Association for Advancement of Science in 1855; by two French writers, Rilliet and Menière in 1856, and by the present reporter in 1857.

To Dr. John Bartlett, of Keokuk, belongs the credit of having projected the first effort to set the question at rest by accumulating a sufficient number of facts to furnish positive testimony either corroborating or refuting the popular idea of deterioration of offspring from such marriages. A loss of health compelled him to

abandon, for a time at least, his intentions, and he has generously placed his material in my hands for the benefit of the Association and profession at large.

Dr. H. P. Strong, of Beloit, Wisconsin, had also collected accounts of instances of family intermarriage for the purpose of deducing and publishing observations upon the subject. But so soon as he heard of the appointment of a committee by the American Medical Association to collect facts in regard to marriages of consanguinity, he placed his many carefully detailed cases at the disposal of the Association through their committee. Such instances of generous sacrifice of labor and purpose as the two foregoing demand our highest appreciation.

It was the design of the reporter to collect not only a sufficient number of observations of marriages of consanguinity to enable us to declare positively in regard to their own essential results, but also to collect a sufficient number of observations of marriage where no such influence obtains, to constitute an authoritative standard, so that by comparing the results of the two classes we might establish beyond controversy the affirmative or negative of the question premising this report.

With regard to the first class, or marriages of consanguinity, my success in collecting facts has been beyond my expectation; my tables will exhibit results of near nine hundred such marriages, a sufficient number to warrant the belief that any additions thereto, if procured in the same manner, would not materially affect the ultimate result. Of marriages of the second class, or between parties neither themselves related nor the descendants of blood relations, I regret to say that my exertions to collect observations have not been so successful. My tables comprise only one hundred and twenty-five observations of this character, which, however correct they may be in selection and statement, are not ample enough in number to justify me in offering them as the average results of marriage where no influence of consanguinity prevails. And unfortunately, there are no researches, so far as I have been able to learn, which establish the average fecundity and vital statistics of marriage in the United States.

The original statistics which appear in my report, have been furnished exclusively by reputable physicians in the various States to which they are credited. The respectable sources from whence they are derived should stamp them as high authority, and I bear cheerful testimony to their accuracy and reliability, feeling satisfied

that all future investigations in this field will bring additional evidence that they are faithful records of truths. But while indorsing the truthfulness of these statistics, it is my duty to state, that those which relate to marriages of consanguinity, should probably not be received as a completely true representation of the results of such marriages; some modification of the mean of results might occur if the statistics of *all* instances of in-and-in marrying, in the Union, for example, could be comprised in one report. It is natural for contributors to overlook many of the more fortunate results of family intermarriage, and furnish those followed by defective offspring or sterility. The mere existence of either of these conditions would prompt inquiry, while the favorable cases might pass unnoticed. Contributors have been particularly requested to furnish, without prejudice or selection, all instances of marriages of consanguinity within their various circles of observation, whatever their results. I have reason to believe that in every instance they have complied with this request so far as it was practicable to do so. Consequently, I have no further cause for supposing that the mean of defects would be lessened, were it possible to include every case of marriage of kindred existing in the population which affords those on my tables, than the mere inference that some cases with favorable results may have passed unnoticed.

Eight hundred and seventy-three observations of marriages of consanguinity of various degrees of relationship are arranged upon the tables. They were furnished from the following States:—

Maine	12	Georgia	30
New Hampshire	44	Alabama	22
Vermont	9	Mississippi	14
Massachusetts	87	Arkansas	7
Connecticut	35	Tennessee	53
New York	57	Kentucky	137
Pennsylvania	34	Missouri	69
New Jersey	33	Illinois	16
Delaware	7	Indiana	73
Maryland	2	Ohio	18
Virginia	24	Michigan	34
North Carolina	11	Wisconsin	42
South Carolina	3		—
		Total	873

That these observations might be more readily studied, they have been arranged upon the tables, in classes corresponding with their estimated grades of relationship, as follows:—

Classes.	Degree of relationship.	Number of observations.
A.	Instances of marriage or incestuous intercourse between brother and sister, or parent and child	10
B.	Instances of marriage or incestuous intercourse between uncle and niece, or aunt and nephew	12
C.	Marriage between blood relations who are themselves the descendants of blood relations	61
D.	Marriage between double first cousins	27
E.	Marriage between first cousins	600
F.	Marriage between second cousins	120
G.	Marriage between third cousins	13
H.	Marriage irregularly reported, all first cousins	30
Total		873

The tables throughout the various classes corresponding to the degrees of relationship, are constructed in the same manner; first, there is a statement of temperament, health, and other circumstances relating to the parents and date of marriage; then the number, sex, and condition of children, the number dead, and causes of death. In a majority of instances, some important item of information is wanting to render the recital of the case complete, yet very few are so imperfect in detail as to be devoid of interest.

In compiling these cases from the numerous letters which brought me the facts, I have as nearly as possible preserved the language of the contributor. The descriptions of temperament have been copied verbatim, except in three instances, in all of which the reporter supposed the meaning of the contributors would be better apprehended by the employment of other language.

In some cases, I have from the tenor of the letters, supplied certain points of unstated information. For example, it has occurred that no statement was made of the health or habits of parents, but some circumstance detailed in the latter has authorized the reporter to describe them, inferentially, as either "good" or "bad," and they have been so entered upon the tables. These instances have been very rare, but it has more often happened that the date of marriage was not mentioned, and in such cases, when any given facts in regard to the age of children, or any other circumstance, led the reporter to infer that those marriages had occurred sufficiently long for the period of reproduction to have transpired, the dates have been denoted by the figures 1835, preceded by a dash. This rule has been adopted, because I have arbitrarily fixed twenty-two years as the extreme average length of time married women continue to produce in this country; consequently, all marriages set down upon

these tables as having occurred before 1835, are supposed to be complete in their results, so far as it regards reproduction.

It is not impossible that some slight errors may have been committed by the reporter in respect to these two interpolations, but they are believed to be so trivial, even if they exist, as to exert no influence over the result; and I would not suppose it important to speak of these alterations except as an act of justice from myself to those who have been my co-laborers.

The attention of contributors has been especially solicited to the temperament and constitutional idiosyncrasies of parents. I have not, however, attempted to deduce any conclusions from the information supplied in regard to temperament. The mere fact that the term itself has a meaning so unfixed and so differently understood, that physicians would have different ideas of its application to the same individual, forms a difficulty at the very threshold of any effort to establish practical laws in regard to the influence which particular conjunctions of parental temperament might exert upon offspring.

In regard to constitutional predisposition and peculiarities of parents, the tables present some interesting facts. It will be perceived that parental infirmities are entailed with great certainty upon the offspring, and this, in the opinion of the reporter, constitutes the strongest argument against the intermarriage of relatives; the fact that family peculiarities, tendencies, and infirmities, either of mind or body, which may be so slight on the part of the parents as to remain latent, become so exaggerated by this "intensifying" of the same blood, that they are in the child prominent and ruinous defects. In this manner I account for the fact that so many of the offspring of kindred parents, who seem in other respects to be well endowed, possess characters so angular and peculiar as to unfit them for the ordinary avocations of life.

In analyzing the defects of offspring, I have assigned a column to each of the four classes of infirmities which are so common in this country as to demand the construction of numerous institutions for their alleviation, viz: deaf-dumbness, blindness, idiocy and insanity; to these I have added a column for epilepsy and one for scrofula. It was my intention to insert a column for the deformed, but as a question arose in my mind as to whether certain personal peculiarities, such as different colored irises, or strabismus, or slight deviations from physical symmetry, should properly be classed under this caption, I determined to omit this

column, and to notice these defects under the head of "Condition of Offspring." Consequently, the deformed are in most instances excluded from enumeration under the head of "defective." Another observation will show that the numbers in the column marked "defective" under-estimate the sum of defects occurring to the offspring of the marriages of consanguinity upon these tables, that is this, in very many instances, where children have died young, their defects have escaped the attention of contributors, and often, perhaps, that of the parents likewise. This remark would hold especially true of congenital deaf-muteism and idiocy, either of which may exist unsuspected in very early infancy. It is not only a natural inference that many deaf and dumb, and idiotic children of the marriages upon these tables, have died without being reported as laboring under these defects, but the supposition finds complete corroboration in the fact that in classes B and D, in both which the percentage of early deaths is largely over that of any other classes, the percentage of defects is less than we are prepared to expect, and the reduction of mean of defects occurs precisely in the columns assigned to deaf-dumbness and idiocy, but more strikingly in the latter.

It has been a source of regret to me that these tables are so voluminous as to require so much space of the published transactions, but every ease has been condensed as much as was compatible with its intelligible presentation. And to have omitted all detail of individual cases would have diminished the value of the report, since other statisticians and physiologists might desire to study these facts in relations different from those presented by the reporter. Another inconvenience attending the great compass of these tables, is that it will prevent their general diffusion through those circles where it is more important to awaken investigation and impart knowledge in reference to this subject. In some part, to obviate this difficulty, I have prepared a table of "Aggregates," which is an exhibit of the results of the marriages comprised on the large tables. The reader will find upon this table the whole number and sex of children, with the sum and percentage of each defect, running through all the classes formed by the various grades of relationship.

I have also prepared two tables of comparative results, which, considered in connection with the table of aggregates, present a condensed exposition of the questions involved in my report. The first of these tables is composed of observations of the results of

marriage where no influence of consanguinity prevails. The isolated observations upon this table are brothers and sisters of parties who have married their kindred, and whose cases are detailed among the consanguinity statistics, and are referred to in this table. The observations occurring in groups of from ten to twenty, have been furnished by highly respectable physicians in the various States to which they are credited. The correspondents who furnished these cases selected them as fair examples of the average results of marriage, under similar circumstances, in their various communities. They were chosen without any other restriction or requisition than that the husband and wife should neither themselves be related, nor have been the immediate descendants of kindred parents, and that the females should have ceased to ovulate, so that we might know that the results were complete as it regards fecundity.

The second table is made up in part from a report to the Secretary of State of Ohio, under an enactment of their legislature requiring a census of the deaf and dumb, blind, idiotic, and insane inhabitants of that State, and the number of each of those classes who were the offspring of marriages between blood relations. This latter clause of the enactment was totally neglected in many counties, and in others it seems to have been illy executed, yet this report contains a large amount of information valuable to my purpose, exhibiting as correlative statistics a remarkable correspondence with the facts furnished in my collection of cases. To illustrate more perfectly the coincidence between the statistics from these two sources, I have divided the observations of marriages of consanguinity furnished by the Ohio report into classes, corresponding as nearly as possible with the classification on my own tables; thus—

Classes.	Degree of relationship.	Number of observations.
A. Marriage or illicit intercourse between brother and sister, or parent and child	3
B. Marriage between uncle and niece	1
C & D. C and D were not noted in their schedules.		
E. Marriage between first cousins	47
F. Marriage between second cousins	28
G. Marriage between third cousins	4
H. Irregular cases, or marriage between cousins, without specification as to degree	72
Total	155

Next, this table comprises the results of two hundred marriages

from the Ohio report, between the parties to which no ties of consanguinity were supposed to exist, yet each of which had given birth to deaf and dumb, blind, idiotic, or insane issue. These were taken—the first hundred from the commencing pages, and the last hundred from the concluding pages of the report, without other selection than that the parents should be reported as not related (and from those counties which had returned marriages of cousins), and that the defects of offspring should be congenital. The parties to these marriages were undoubtedly the subjects of some influences tending to the depravation of their issue, and yet a reference to the tables will show that the percentage of defects to their offspring is not so great as among the children of the consanguinity marriages. Lastly, the sum of results of marriage upon the first table of comparative results, is brought to this second table, and the percentage of defects and deaths carefully computed.

With a view to ascertain the character and degree of influence exerted upon the vital statistics of marriage by the great diversity of climate of the United States, I have arranged the observations comprised in the three most comprehensive letters, representing classes of consanguinity marriages, viz., C, E, and F, in “climatic divisions,” or belts, bounded by the degrees of latitude between which they were obtained. Thus all observations, in each of these classes from between the 32d and 36th degrees of latitude are embraced in the first division, under the caption of “South;” those obtained from the 36th to the 40th parallel, constitute the second, or “Middle” division; those from the 40th to 44th parallels, the third and “North” division. This table would have been of some practical utility, could I have been successful in obtaining a sufficient number of observations of vital statistics of marriage, where no kinship existed, to have admitted of a similar division and comparison of results; now, however, it has nothing to recommend it, except that it has been prepared with much labor, and is free from errors.

The mortuary statistics of the offspring of marriages of consanguinity, and of the offspring of marriage between non-related parties, are interesting subjects of comparison. I am compelled, from lack of time and space, to refer those who seek for precision in regard to the causes of death among the children of kindred parents, to the large tables; here I can only give an abstract containing all the causes of death, so far as known, among the children of non-

related parents, and some of the chief causes of mortality to the offspring of marriages of consanguinity.

Of the former, one hundred and thirty-four died young; sixty-nine of this number have the causes of death assigned—the remainder unknown. Eight hundred and eighty-three of the children of consanguinity marriages died young; the cause of death is given in four hundred and eighty-six of this number—the remainder unknown.

Marriages of Consanguinity.		Marriages of the Non-related.

Total	475		

I have made great effort to ascertain the probable proportion of the deaf and dumb, blind, idiotic, and insane, in our asylums, who are the descendants of blood intermarriages. This effort has not been successful, from the difficulty principals of such institutions

find in gaining the requisite facts. Parents are frequently sensitive on this point; and it is a delicate matter for principals to attempt investigations which the friends of the beneficiaries supposed to be unauthorized by the regulations of their various institutions.

I feel satisfied, however, that my researches give me authority to assume that over ten per cent. of the deaf and dumb, and over five per cent. of the blind, and near fifteen per cent. of the idiotic, in our State institutions for subjects of those defects, and throughout the country at large, are the offspring of kindred parents, or of parents themselves the descendants of blood intermarriage.

The principal of an institution for deaf-mutes communicates the following statement:—

“Of one hundred and eighty-three cases of congenital deaf-dumbness, twenty-eight were known to be the offspring of blood relations. My inquiries have not extended to more than half of the hundred and eighty-three. My impression is that of those born deaf and dumb, at least one-fourth are the children of cousins. It is very difficult, as you are aware, to get reliable information on this subject. * * * One man in this State denied that he had married a blood relation; I have since learned that he and his wife are first cousins, and have six children, three of whom are deaf and dumb.”

The principal of another deaf and dumb asylum—a close observer, and one who has long occupied the position—writes as follows: “Since I wrote to you, a day or so ago, I have remembered that we recently received four sisters, the children of parents who were own cousins. They were all the children they had, I believe. The further I extend my inquiries, the greater the number of deaf mutes I find who are the children of near relatives; I have no doubt that at least ten per cent. are the offspring of persons so related.”

From another institution for deaf mutes, the following tabular statement was received:—

Whole number of pupils.	Males.	Females.	Scrofulous.	Consumptive.	Idiotic.	Known to be offspring of kindred parents.	Parents not related.	Doubtful as to relationship of parents.
139	71	68	67	7	10	21	32	58

This estimate shows over fifteen per cent. of the whole number of pupils to have been offspring of consanguinity marriages.

With regard to the frequency of idiocy as a result of intermarriage of relatives, and the probable proportion of those laboring under this defect who are descendants of such unions, I have received the following statement from a highly respectable physician of Connecticut:—

“Two years ago circulars were issued to every physician in Connecticut, to clergymen, to town-clerks, and to the first selectman of every town in the State, containing minute questions relative to the probable causes of the cases of idiocy reported. The question, Whether consanguinity was a cause or not, was answered in 160 cases, and assigned as a cause in 20 of them. An adequate cause of idiocy was reported in 310 cases, but the question concerning consanguinity was answered in only 160 cases. Taking it for granted that every instance of relationship of parents, in the 310 cases, was reported, we find that consanguinity of parentage is a cause of $\frac{1}{8}$ th of the idiocy in Connecticut. If we follow the idea that no attention whatever was paid to the question, except in the 160 cases, then we find it a cause of $\frac{1}{8}$ th—taking the mean, it is the cause of $\frac{3}{8}$ ths of all the idiocy in the State.”

In addition to these facts, and others which I have gained by correspondence with gentlemen who have given close attention to these points, the following perfectly legitimate process of computation confirms me in the opinion that the previously announced estimates are very nearly correct. The classes C, D, E, F, G., of the consanguinity tables, comprise 787 marriages of cousins, 246 of which have given issue to deaf and dumb, blind, idiotic, or insane children.

Admitting the same ratio to prevail, the Ohio report, which contains 151 marriages of cousins, followed by deaf and dumb, blind, idiotic, or insane offspring, would indicate the existence of 332 other marriages of cousins in the same population, not followed by such defects. The counties which furnish this 151 marriages, as above, and which are supposed to comprise in their limits 332 unreported marriages, making a total of 483, contained in 1850 a population of 1,528,238. If the same ratio be supposed to exist throughout the Union, there would be found to the twenty millions of white inhabitants, six thousand three hundred and twenty-one marriages of cousins, giving birth to 3,909 deaf and dumb, blind, idiotic, and insane children, distributed as follows:—

Deaf and dumb	1,116
Blind	648
Idiotie	1,854
Insane	299

Then, if the figures of the last United States Census still applied to our population, there would now be found in the Union:—

9,136 deaf and dumb, of whom, 1,116, or 12.8 per cent., are children of cousins.
 7,978 blind, of whom 648, or 8.1 per cent., are children of cousins.
 14,257 idiotic, of whom 1,844, or 12.93 per cent., are children of cousins.
 14,972 insane, of whom 299, or 1.9 per cent., are children of cousins.¹

I invite the attention of gentlemen of this Association to this calculation of probabilities either to confute or confirm it by any facts in their possession.

A very cursory examination of the tables of my report will suffice to show that *pari-passu* with the increment of the same blood the sum of defects of offspring is likewise increased. Classes D and G present exceptions to this rule. As it regards D, the supposed reason for this deviation has been already stated, namely: that its mortality list is so large; while class G presents so few observations as to satisfy us that they attracted notice solely because of their unfavorable results.

But notwithstanding these two exceptions, the increase and diminution of calamities to offspring correspond so closely with the increase and decrease of relationship, as to fix the conviction firmly in the mind of the reporter, that multiplication of the same blood by in-and-in marrying does incontestably lead in the aggregate to the physical and mental depravation of the offspring. And if we admit the above statement, which the observations here presented abundantly prove—that defects of offspring multiply precisely as we multiply the same blood—and to this admission join the fact that all those contingent circumstances of parental health, habits, proclivities of constitution, sexual incongruity, &c., are as liable to affect one class as another, we cannot rationally assign these effects to any other influence than that of consanguinity.

I am constrained to express my sincere regret that this report must be offered in a crude, unfinished state. The study of this interesting subject is, if thoroughly investigated, an elaborate science,

¹ The reader will perceive that since these estimates were made, some cases have been added to the consanguinity tables; also, that in the computations small fractions have been occasionally left off, or slightly altered when appearing in the quotient.

and the reporter labored under erroneous impressions when he supposed that the important facts bearing upon it could be collected, arranged, and properly elucidated in the short period of a year. I cannot prosecute these researches any further, having already devoted more time to them than it was proper to spare from the more practical and important branches of the profession. It was impossible to incorporate more than a mere tithe of the large amount of interesting and valuable information in my possession; the remainder I will carefully preserve, and hold subject to the call (under certain limitations) of any physiologist¹ whose tastes, attainments and leisure, qualify him for the task of completely elaborating the subject.

The thanks of the Association are eminently due to those physicians whose love of science induced them to assume the disagreeable office of eliciting and supplying the information comprised in these tables. Their contributions were furnished under a pledge that no individualization of contributors was to enter my report; consequently, no other motive could have actuated them than an earnest interest in science, and in all questions touching the well-being of their species. Personally, I offer them my grateful acknowledgments for their co-operation. I trust they will concur with me in the opinion that the chief merit of my report is, that the facts they have furnished me have been fairly and honestly transferred to its pages.

¹ Should Dr. Bartlett recover his health, and desire to prosecute his work, his claims are entitled to first consideration.

CLASS A.—*Instances of Marriage or Incestuous Commerce*

PARENTS.							
Number of observations.	Sex of parents in reference to.	TEMPERAMENT.	HEALTH, HABITS, ETC.	OCCUPATION.	WHEN MARRIED.	AGE AT MARRIAGE.	
1	M. F.	Sanguine. "	Both of good constitution and habits; wife, husband's half sister.	Farmer.	1817	M. 21	F. 17
2	M. F.	Unknown. Bilious sanguine.	Both healthy and good habits; half brother and sister.	Farmer.	1840	25	..
3	M. F.	Unknown. "	No report of health or habits. The husband was offspring to the same father, but by a former wife, consequently half sister to his wife, with whose family he had but little association previous to his marriage; both belong to lower walks of life.
4	M. F.	Unknown. "	Husband and wife were offspring to the same father, the former legitimate, the latter illegitimate; the husband formed an attachment to his half sister while ignorant of her parentage; a revelation of the truth did not alter his purpose, and they were married.	..	—1835
5	M. F.	Nervo-lymphatic. Sanguine.	Male was not healthy.—Female, robust; no statement of habits. These parties were not married, but were guilty of incestuous intercourse; they were full brother and sister.	..	1837
6	M. F.	Unknown. "	No report of health or habits; parties were full brother and sister, and had incestuous intercourse. Both were finely developed and handsome, with dark hair and eyes, resembling greatly.	..	1846	20	14
7	M. F.	Unknown. "	No report of health and habits; parties were half brother and sister, one being a legitimate, the other an illegitimate child of the same father. They married without any suspicion of their relationship.	Farmer.	—1835	Young.	
8	M. F.	Unknown. "	Both good health; incestuous intercourse between full brother and sister.	..	1836	Young.	
9	M. F.	Unknown. "	Both supposed to be healthy; an instance of incestuous commerce between father and daughter.	..	1830
10	M. F.	Unknown. "	The male of excellent health and intellect, and good social position, seduced his granddaughter, at that time a model of female beauty and good mental endowments.	Lawyer.	1827	Unk'n. 17	

between Brother and Sister or Parent and Child.

CHILDREN.															
Number of children.	SEX.		No. defective.	Deaf and dumb.	Blind.	Idiotic.	Insane.	Epileptic.	Scrofulous.	Died young.	SEX.		Age at death.	CAUSE OF DEATH.	CONDITION OF CHILDREN, REMARKS, ETC.
	Male.	Female.									Male.	Female.			
7	6	1	7	1	Six cannot speak so as to be understood, except by their immediate family.
5	2	3	5	5	...	1	3	
1	1	1	This child is marked with the singular peculiarity of having one blue and one black eye.
5	5	5	Three are complete idiots, the other two imbeciles.
1	..	1	This child is now 20, and is healthy, bright, and active.
1	..	1	1	This child is an albino, of delicate constitution, not deficient in mental endowments, is tall and stooping, and has an awkward shambling gait, now 12 years old.
7	3	4	6	6	These children, except one son, have six fingers on each hand, and six toes on each foot, and are otherwise "hideously deformed" as well as mentally imbecile.
1	1	..	1	1	This child is now an adult, a mere pigmy in size, with a badly proportioned body, and a fatuous vacant expression of countenance.
2	2	..	2	2	These children were twins, and had pelvis resembling the female in form. After maturity they walked like females, and were feeble and scrofulous.
1	1	..	1	This child presents a peculiar appearance, his extremities are longer than natural, his movements are lax and swinging, his countenance strange, his moral proclivities were also striking and abnormal; he is now an inmate of a poor-house.

CLASS B.—*Marriage or Commerce between*

PARENTS.						
Number of observations.	Sex of parents in reference to.	TEMPERAMENT.	HEALTH, HABITS, ETC.	OCCUPATION.	WHEN MARRIED.	AGE AT MARRIAGE.
1	M. F.	Sanguine. “	Both good constitution and habits; female of great personal beauty. The wife was husband's maternal aunt. Both of good social position and easy circumstances of life, and married to cover shame of pregnancy from illicit intercourse.	Farmer.	1836	M. 27 F. 23
2	M. F.	Bilious. “	Both robust constitutions, with active, temperate habits. Wife, niece to husband.	Farmer.	—1835	30 17
3	M. F.	Bilious. Nervous.	Not reported. Uncle and niece.	..	1850	25 19
4	M. F.	Lymphatic. Sanguine.	Intemperate habits. Aunt and nephew.	Laborer.	1830	20 30
5	M. F.	Lymphatic. “	Not reported. Nephew and aunt.	Farmer.	1822	22 24
6	M. F.	Nervous. Sanguine.	Both good constitution and habits. Uncle and niece.	Farmer.	1827	23 ..
7	M. F.	Bilious. “	Both dark skin, hair and eyes; health good; medium size. Nephew and aunt.	Farmer and stonemason.	1837	25 30
8	M. F.	Sanguine. “	Both of robust health, and long-lived; still living; over 70 years of age; of thin flesh; resemble so strikingly that they might readily be taken for brother and sister. The wife is husband's niece by his sister.	..	1810	Young.
9	M. F.	Unknown. “	Both healthy and apparently vigorous, and were never previously married.	..	1849	63 23
10	M. F.	Bilious. “	Both of excellent health and good habits, with dark hair and black eyes; the female is daughter to the husband's brother.	..	1853	Young.
11	M. F.	Nervous. Leucophlegmatic.	Male, healthy, with regular active habits.—Female, healthy, but indolent; was aunt to her husband.	Mariner.	1830	20 30
12	M. F.	Unknown. “	Both of good health and habits; of German family.	Young.

Uncle and Aunt or Aunt and Nephew.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

..

The two defective are males; one is deaf and dumb, blind, an idiot, and deformed; the other is epileptic. The females are mediocre in intellect, and altogether unattractive in personal appearance.

Accidental.

Nothing remarkable about children, except one male is ungainly and awkward.

..

The union hitherto sterile.

Marasmus.

All were deformed in hands and feet.

Unknown.

The three noted as defective were very much deformed. The one living is a male grown, has curvature of spine, and otherwise defective.

..

All scrofulous.

..

Barren.

Unknown.

One of the survivors is deformed from congenital spinal curvature, but is otherwise a man of average intellect and business capacity, and of good health. The other is ruddy and healthy in appearance, but, at 40, is a mere child in intellect, and dependent upon his father and deformed brother for support. Both have been married some years, but without issue.

..

Sterile.

..

This child is of fine healthy appearance, and seems to be of precocious intellect; had a convulsion at 2½ years of age, cause unknown.

Typhoid fever.

The female myotonic; all feeble.

Marasmus.

The sons are healthy; the female was always feeble, and never walked.

CLASS C.—*Marriage between Cousins,*

PARENTS.						
Number of observations.	Sex of parents in reference to.	TEMPERAMENT.	HEALTH, HABITS, ETC.	OCCUPATION.	WHEN MARRIED.	AGE AT MARRIAGE.
						M. F.
1	M. F.	Unknown. "	No report of constitution or habits. Two brothers married each a second cousin. The male in this union was the product of one of the above marriages, the female of the other, consequently were double first cousins.	No report.	—1835
2	M. F.	Nervous. "	Constitutions good, habits temperate. Whether the parties to this marriage were first, second, or third cousins is not stated, but their ancestors are reported to have intermarried for two preceding generations.	Farmer.	1790	Usual age.
3	M. F.	Bilious. Sanguine.	The parties to this marriage are second cousins, their parents were second consins, their grandparents first cousins, and their great and great-great grandparents also first cousins; thus constituting five consecutive generations of children who practised inter-marriage.
4	M. F.	Phlegmatic. Norveus.	Male, good health and habits; a laborious agriculturist. — Female, good health and active habits.	Farmer.	1813	27 21
5	M. F.	Phlegmatic. Nervous.	Both good health and habits. Parents in Nos. 4 & 5 were mutually brother and sister (that is, the male of one was brother to female of the other), while each was first cousin to his wife; their parents were also double first cousins. To illustrate this intricate entanglement, suppose that A and C, two brothers, married B and D, two sisters, their double first cousins; the union of A and B resulted in a son D, and a daughter F: that of C and D in a son E and a daughter G; then lf E marries F, and G marrios H, we have the relationship of parties in Nos. 4 and 5.	Farmer.	1816
6	M. F.	Unknown. "	No report; parties were third cousins.
7	M. F.	Unknown. "	Female, daughter of No. 94, Class E. No report; third cousins. Female, daughter of No. 94, Class E.
8	M. F.	Unknown. "	Both of good constitutions and habits, condition in every respect supposed to be favorable to production of healthy offspring. The male was offspring of cousins, and married his first cousin.	..	1830
9	M. F.	Bilious.	Both were large, healthy, good intellects, and industrious habits; they were first cousins, and so were their paronts.	Farmer.	1797	24 ..
10	M. F.	Unknown. "	Both good health and habits. The male has feeble intellect, is in personal appearance outrageously ugly, squints, and distorts his mouth in a disagreeable manner. The male was offspring to Class E, Nos. 94, 95, and 96, and first cousin to his wife.	Farmer.	..	Young.
11	M. F.	Bilious. Nervous.	Male vigorous; intemperate at times. —Female vigorous; no report of habits. Those parties are first cousins, and their parents also.	"Jack at all trades."	1850	25 20

themselves the Offspring of Kindred Parents.

CHILDREN.															
Number of children.	SEX.		No. defective.	Deaf and dumb.	Blind.	Idiotic.	Insane.	Epileptic.	Scrofulous.	Died young.	SEX.		Age at death.	CAUSE OF DEATH.	CONDITION OF CHILDREN, REMARKS, ETC.
	Male.	Female.									Male.	Female.			
2	1	1	2	2	2	1	1	..	Unknown.	Both were congenitally deformed and complete idiots.
5	2	3	2	The two enumerated as defective are nyctalopic, seeing objects with much more facility and ease during twilight than during a bright day; they have also a peculiar twinkling or dancing motion of the eye during a strong light. There are no complete idiots in the family, but all are in a state of mental weakness bordering upon that condition.
3	2	1	Remarkable for both mental and bodily vigor.
2	1	1	2	..	2	1	..	1	1	..	15	Epilepsy.	The female would be regarded as half-witted, married and died at 18 in her first labor.
4	2	2	4	..	1	1	..	2	1	1	14	Epilepsy. Female of fever.	Survivors of strikingly feeble intellect and fragile constitutions.
3	3	3	1	Scrofula.	The two survivors have scrofulous diathesis strongly marked.
5	5	1	Scrofula.	Survivors very feeble in mind and body.
6	3	3	6	Constitutions are extremely feeble; the males are effeminate in appearance, two have congenital defects of the eyes; the minds of all are below mediocrity, and one is but a degree removed from idiocy; all are remarkably unprepossessing in personal appearance.
4	2	2	3	1	2	1	6	Unknown.	Survivors have scrofulous ophthalmia, and evince both mental and physical deterioration.
3	2	1	All seem to be at least not inferior to their father, but are still too young to determine any question regarding mental endowments.
5	5	5	Brain diseases.	The children were small and feeble at birth, and all died during the first year.

	Male.	Female.									Male.	Female.			
4	3	1	4	2	..	1	..	1	..	1	..	1	2	Hydrocephalus.	The deaf and dumb children of these parents had also strabismus, defective vision, and club feet.
4	3	1	1	1	..	4 mos.	Diarrhœa.	Survivors delicate, but have no developed disease.
1	..	1	Living and normal, aged 4.
..	Sterile.
..	Sterile.
11	8	3	5	..	5	5	4	1	2 mos. 2 mos. 9 mos. 16 2 wks.	Whooping-cough. " " Dysentery. Unknown.	The blind children had congenital cataract (two males and the three females); two other males were twins and died at two months; one other male died at two weeks. It is not known whether these children who died so young had cataract or not. The male who died at 16 grew to that age healthy and with normal eyes. One male, now an adult, has good eyes, and is healthy and bright. Two males and two females are now blind adults. One male has had one eye operated upon three times without more than a slight improvement of vision. The cataract feels and looks like a small piece of buckskin, and was with great difficulty cut or torn; some rents were, however, made in it, but it had no effect in procuring its solution. They have all some vision, but very imperfect, the light apparently finding its way in on the sides of the eyes as they turn their heads obliquely to an object which they wish to examine. Their eyes are very unsteady, having a continual vibrating or oscillating motion. An acephalous monstrosity. No other child to this date.
1	1	1	Stillborn.	
1	Still young, sex and condition not known.
..	Lived together several years without issue.
4	2	2	2	2	2	4 6	Unknown. "	The two defective were cripples as well as idiotic; although they died at the ages of 4 and 6, they were never able to sit alone, the survivors did fail to become persons of average mental and physical capabilities.

Farmer.	1840	21 ..
60	M. F.	Unknown. “	No report of health or habits. The female was daughter to No. 58, and second cousin to her husband. The husband died four years after marriage, and she still lives in widowhood.	Farmer.
61	M. F.	Unknown. “	Both very small and delicate, and resemble in form and family characteristics. The female died some years after marriage, and the male married a woman not related, who has borne several children, condition unknown. These parties were each descendant of first cousins, and were themselves first cousins.

themselves the Offspring of Kindred Parents—Continued.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.Bilious fever and
intestinal worms.

Infancy.

Sex unknown, as all died in infancy, except one, a female, who is now 15 years old, dark hair, skin, and eyes, scrofulous and unhealthy, but good looking.

Unknown.

1 Birth.

Survivors not very healthy.

Dyspepsia.

Survivors nearly all grown, and quite unhealthy.

Stillborn.

Survivors unhealthy; one dyspeptic, one neuralgic, one a semi-idiot.

..

All grown and healthy; no defects, except one male is cross-eyed.

..

Dwarf.

Unknown.

Survivors small, but healthy; three are albinos and myopic, otherwise apparently normal and mentally bright.

..

One stammers badly.

Insanity.

Survivors feeble, with undoubted signs of early decay.

..

Phthisis.

The only living child is a physician of ordinary capacity, and has never had a tooth; the last child was also born without a palate, and otherwise deformed about the mouth.

..

Children could not hold up their heads until between 1 and 2 years old, nor walk until between 2 and 3.

Scarlatina 1.

Mother had several abortions, then three children, who perished a few days after birth; of the survivors, one is healthy, the other epileptic.

..

Brain fever.

The survivors healthy, and have married, having themselves healthy children.

..

The three males have a spinal weakness, by which they are prevented from rising from a sitting posture without first rotating the body from side to side, and when placed recumbent upon the back are compelled to turn upon their faces before rising.

..

Poor, weak, feeble things, both mentally and physically.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

..	..	This daughter has fair complexion, hair inclining to red; in appearance is fragile, but is not known to have been sick; intellect good.
Cyanosis.	..	The two oldest sons have defective constitutions; one has attacks of partial delirium; the two younger children have more health, but the daughter finds it difficult to keep up with her classes at school. The mother expressed fears to the contributor that her relationship to her husband had deteriorated their offspring. One is a complete idiot; the other at best but half witted; both grown.
Scarlatina.	..	One female is normal; the other two are near sighted, and the eyes of both are in continual dancing motion; the head of the male is also unsteady.
..	..	Clinb-foot.
..	..	All healthy and intelligent.
Disease of brain)	..	Three of survivors of "very feeble
Inflammatory dis-	..	intellect," all below mediocrity.
ease.	..	
" "	..	
..	..	Good physique; one seems to be
..	..	a dull boy.
..	..	Survivors normal.
..	..	One year old; normal.
..	..	Normal.
Dysentery.	..	
..	..	
Typhoid fever.	..	
..	..	One male and two females of the
..	..	survivors are deaf mutes.
Scrofula 3.	..	The scrofulous children had ul-
Convulsions 1.	..	ceration of cervical glands and
..	..	of the internal ear; one of the
..	..	deaf mutes married, and is the
..	..	wife in No. 12, Class C.
Hydrocephalus 2.	..	One of the survivors is wife to
..	..	No. 13, Class C; two of the sur-
..	..	vivors decidedly scrofulous.
..	..	Normal.
Dysentery.	..	Normal.
Scarlatina.	..	Normal.
Measles.	..	
Unknown.	..	Normal.
..	..	Sterile.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

.. All living from 35 to 50 years of age; one is deaf, and speaks like a young child; one is badly asthmatic; others normal. They have married into healthy families not related, yet several of their children have died of phthisis, others manifest that tendency.
Sterile.

.. Inanition. The first was imperfectly developed, the second (222) is afflicted with ulcerations probably scrofulous.

.. Unknown. The eyes are faulty in configuration.

.. "Defective uavel." Survivor intelligent and healthy.

.. These children should not be termed idiots, but lack intelligence.

.. One has a peculiar formation of the ear, otherwise there are no physical defects; in intellect they are as children of No. 225.

.. Never had any living children, but miscarried three or four times at seventh month.

.. Exhibit evidences of inferiority to their parents; intellect ordinary.

.. Consumption 3. Acute diseases 2. Killed 1. All arrived at puberty before death; survivors normal.

.. No children, two miscarriages at seventh month; soon after the last of which the mother died of fever.

.. The oldest was strabismic, otherwise they are perfectly developed mentally and physically.

.. The child is also apparently idiotic; but the contributor does not confidently impute this to influence of consanguinity, as the mother is also of feeble intellect.

.. All living, no defects.

.. All the survivors are in rather ill health; those who died, died for the most part before maturity.

.. Nothing unusual about survivors.

.. Survivor is fifteen, sprightly and healthy.

.. Both sprightly intellectually, but have enlargements of cervical glands, and other indications of scrofula.

.. Stillborn. Survivors normal.

.. Stillborn.

PARENTS.

CHILDREN.

CAUSE OF DEATH.

CONDITION OF CHILDREN.
REMARKS, ETC.

Age at death.

..

The two males small in size, but should scarcely be called dwarfs.

..

All living, and without notable defects; the daughter is not comely, and none of the offspring are equal, mentally or physically, to their parents. Congenital cataract.

..

Inflammatory.

Survivors are of good constitution, sound intellect, and some of them above mediocrity in latter respect.

..

..

Diminutive, but sprightly.

..

..

Sterile.

..

..

..

..

Unknown.

Survivor is now an adult and normal; those who died were of diminutive size, badly developed.

..

..

Remarkable for diminutive proportions and mental imbecility.

-1

4

14

Unknown.

Dysentery.

Killed by accident.

One daughter strabismic; the oldest married and bore 3 children, then died of abscess of cerebellum; another daughter married her sister's husband, but is without issue.

..

..

Normal; married and has several children.

..

..

All healthy and bright.

..

..

Sterile.

..

..

Fair health and habits, but none of them equal to parents.

-3

-20

Unknown.

..

All living and healthy.

..

..

..

..

Two died in infancy, one at 25. The living child is not bright. Sterile.

..

..

None defective, either physically or mentally.

..

..

All deficient in intellect, but not complete idiots.

..

..

All grew up healthy and strong.

-5

..

Survivors active and healthy.

PARENTS.

Number of observations.	Sex of parents in reference to.	TEMPERAMENT.	HEALTH, HABITS, ETC.	OCCUPATION.	WHEN MARRIED.	AGE AT MARRIAGE.
263	M. F.	Unknown.	Both healthy and regular habits; male of light complexion, female brunette.	Laborer.	1852	M. F. Young.
264	M. F.	Unknown.	Not robust; both died of phthisis, age not stated.	Merchant,	1820	Young.
265	M. F.	Unknown.	Both good health and habits.	..	1805	Young.
266	M. F.	Unknown.	Both good health and habits.	Farmer.	1802	Young.
267	M. F.	Unknown.	No report of health and habits.—Wife, strumons.	Merchant.	1842	Young.
268	M. F.	Unknown.	Both good health and habits.	Farmer.	1817	Young.
269	M. F.	Unknown.	Both good health and habits.	Manufacturer.	1840	Young.
270	M. F.	Unknown.	Both good health and habits.—Male previously married to a woman not related.	Farmer,	1790
271	M. F.	Unknown.	Both good health and habits, and with no constitutional peculiarities, or other surrounding circumstances likely to affect integrity of offspring.	..	1820	Young.
272	M. F.	Unknown.	Both healthy and of good bodily development, and average intellectual endowment; wealthy, and good habits.	Farmer.	1836	Young.
273	M. F.	Unknown.	Both healthy in every respect.	..	—1835	Young.
274	M. F.	Nervo-bilious.	Both good health and habits; male died early, and the widow marrying a man not related had three sprightly, well-formed children.	..	—1835	Young.
275	M. F.	Phlegmatic and stupid.	Both ordinary health, but very regular habits.	Farmer.	1846	30 30
276	M. F.	Unknown.	Both good health and habits; the female had hare-lip.	Farmer.	1843	22 20
277	M. F.	Sanguine.	Father, very robust; mother, average health; both good habits and intellectual. These parents do not know of any scrofula, or other hereditary taint in their families.	Farmer.	—1835	Young.
278	M. F.	Bilious. Sanguine.	Good health and habits.—Wife, delicate; good habits. No hereditary taint in families; no scrofula ever manifested.	Farmer.	—1835	Young.
279	M. F.	Phlegmatic.	Both delicate health; good habits; no scrofula known of in family, and both lived to a great age.	Farmer.	—1835	Young.
280	M. F.	Unknown.	Both good health and habits.—Wife died after the birth of seventh child, and the husband married a woman not related, who bore him three or four sprightly, fine looking children	..	—1835	Young.
281	M. F.	Phlegmatic.	Both good health and habits.	Farmer.	—1835	Young.
282	M. F.	Unknown.	Both good health and habits.	Farmer.	1832	Young.
283	M. F.	Unknown.	Both good health and habits.	Farmer.	1812	Young.

First Cousins—Continued.

CHILDREN.															
Number of children.	SEX.		No. defective.	Deaf and dumb.	Blind.	Idiotic.	Insane.	Epileptic.	Scrofulous.	Died young.	SEX.		Age at death.	CAUSE OF DEATH.	CONDITION OF CHILDREN, REMARKS, ETC.
	Male.	Female.									Male.	Female.			
3	1	2	1	1	..	1	—3	Hydrocephalus.	Youngest child has convulsions.
2	2	2	—18	Phthisis.	
6	2	4	All healthy and bright.
1	..	1	Delicate but bright and active; married a cousin, see Class C, No. 16.
4	1	3	1	1	Oldest daughter scrofulous, others healthy.
4	2	2	All bright and healthy.
1	..	1	1	..	1	2	Diarrhœa.	No other children born since.
11	5	6	1	1	..	—5	Unknown.	Several of the survivors are rather odd and are not considered of average intellect, or equal to the children of the same father by his subsequent marriage.
4	1	1	3	—5	Unknown.	The eldest child, a male, was born with a head of unusual dimensions, has now grown to manhood, with a head of the same disproportionate size, was subject to convulsions in early life.
9	3	3	The mutes are of good minds (2 males and 1 female); the other children are well formed and sprightly.
8	1	1	1	1	..	The idiot affected with feeble convulsions until its death. The remainder normal.
3	2	1	1	1	The daughter well endowed, is married and has one child; one son is also of good intellect and physical development.
1	Still young, but with no perceptible defect.
6	3	3	—2	Convulsions.	One of the children that died and two of the survivors have hare-lip.
6	2	4	2	2	1	..	1	18	Phthisis.	One of the survivors has strumous ophthalmia, the others normal.
10	2	8	1	1	2	Unknown.	The scrofulous child is badly affected, the remaining seven are healthy unusually intelligent women. Three are married and have children.
8	3	5	1	1	All easy, quiet, good natured, without energy or force of character.
7	7	All grown, <i>very dull</i> , scarcely superior to complete idiots; weak-eyed and cross-eyed.
9	Fully equal to parents, both physically and mentally.
1	1	Twenty-two years old, no defects.
11	7	4	4	..	4	1	Unknown.	Congenital cataract the cause of blindness.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

..

All below mediocrity in intellect.

..

All healthy and normal.

Hydrocephalus 2.
Dropsy 1.
Scarlatina 1.
Hydrocephalus 2.
Tuberculosis 1.

The living children are scrofulous and subject to swelling and inflammation of glands.

..

All healthy.

..

All mentally below par, and one a complete idiot.

..

Three of the males were idiots; two of the daughters are married and have families.

Consumption.

Survivors grown and normal.

Stillborn.

..

All grown and without perceptible defect.

..

The ages are respectively, 13, 11, 9, 7, 5, 2 years.

..

Sex not reported; now 7 years old and healthy.

..

No physical defects, and mentally about like the father.

..

No physical defects; average minds.

..

No physical defects; average minds.

18
6 mos.

..

All feeble in body and mind; one has rickets and bad curvature of the spine, is dwarfish.

Drowned 1.
Fever 1.
Erysipelas 1.

The scrofulous cases are cutaneous affections; one is an affection of the hip, destroying the joint and use of the limb; the five defective are all cripples, with a total loss or imperfect use of the lower extremities, from ankylosis of the hip, knees, or ankles, contraction of ligaments, or atrophy of muscles; one cannot walk at all; three with crutches; one very badly without.

Inflammation of brain 3.
Phthisis 1.
Fever 2.
Injury 1.

None very bright.

..

Normal and healthy.

Convulsions.

The living children are healthy and tolerably bright.

Convulsions.

The mother was tuberculous at birth of the child, and died of phthisis shortly afterwards.

Diseased brain.

The child was considered idiotic.

..

The eldest a perfect idiot; the youngest partially so; others normal.

..

The child is deficient in intellect and cannot speak intelligibly, though now 5 years old.

396	M. F.	Nervous.	Both not robust; husband strumons.	Farmer.	—1835	Young.	
397	M. F.	..	Small, delicate, weak pulmonary system; intelligent.—Wife, tall, thin; medium health; rather weak intellect.	Paper-hang-cr.	1840	Young.	
398	M. F.	..	Tall, healthy, of medium weight; strong intellect; educated.—Wife, always feeble.	Profession.	1830	Young.	

First Cousins—Continued.

CHILDREN.															
Number of children.	SEX.		No. defective.	Deaf and dumb.	Blind.	Idiotic.	Insane.	Epileptic.	Scrofulous.	Died young.	SEX.		Age at death.	CAUSE OF DEATH.	CONDITION OF CHILDREN, REMARKS, ETC.
	Male.	Female.									Male.	Female.			
1	Five years old, normal.
8	5	2	3	1	Unknown.	Three are Albinoes, well formed, but small and near-sighted.
9	8	1	1	1	One has dyspepsia; remaining seven are healthy and sensible.
6	4	2	2	1	1	1	1	..	18 mos.	Unknown.	The child that died had a singularly deformed foot, the heel projecting as far behind as the toes in front; a female, aged 6, is paralyzed, cannot articulate, and seems idiotic.
5	3	2	2	1	..	20 22	Consumption. “	Children not so well formed as parents, but seem healthy; the female who died had married her double cousin 18 months before, but had not been pregnant.
4	2	2	Healthy, sensible, and well formed.
7	5	2	1	1	All well formed.
9	All physically sound, but mentally weak, especially as compared with a large circle of family relations.
8	1	1	All dwarfish and weak minded.
7	2	One deformed with a short arm; another, spinal disease.
6	3	3
3	1	1	—5	Croup.	Slight ectropia, no other defects.
6	6	Feeble and almost perfect Albinoes.
3	2	2
7	No defects physically, but mentally stupid.
9	6	3	2	2	..	20 10	Fever. Dysentery.	Survivors healthy and sensible.
7	No defects.
6	3	3	3	One with club-feet, one “enlarged abdomen,” one spinal disease.
3	3	3	Children born at intervals of two years; parents and children living.
6	1	1	All healthy and intelligent; the mute is the last child, and the defect is attributed by the father to ulceration of the ear in infancy, and the use of caustic to arrest the discharge.

..

..

..

..

..

..

..

..

..

..

..

..

..

..

..

..

All healthy ; from 4 to 10 years of age.

The survivors are anemic, but otherwise of average health. The survivors of average health ; some are married and have healthy children.

One female has phthisis, remainder healthy.

Still living and healthy, mentally and physically.

The two youngest twins, and one blind ; the sons healthy.

The first child was normal, but small ; the second child was malformed, having but one arm, and died young ; the two last are normal.

Five are medium.

Four are deformed, one has rachitis ; one only is mediocre in health and intellect.

Of good physical health and unusually precocious intellects.

The eldest is an intelligent, healthy woman ; the mates are of active temperaments, but limited capacity.

One is possessed of moderate health and intellect.

These three defective were normal until adolescence, when they became imbeciles, with paralysis of entire muscular system.

The idiotic daughter is ten years old and cannot walk.

One died of morphia, given by its mother through mistake.

Sterile.

..

All grown and well developed.

The child set down as normal died in infancy.

All well developed except the youngest, which is small and feeble.

The defective are not entirely idiotic, but are "simple."

Two of the idiots were insusceptible of improvement ; one never learned to talk. Of the five set down as not defective three were above mediocrity, and two below that standard.

CHILDREN.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

..

Did not talk until his sixth year, has tolerable health, but is a semi-idiot.

..

All grew up healthy and bright.

Scrofula.

Survivor not robust but bright.

Convulsions.

Unknown.

One female married and died of stomatitis materna after first child; remainder bright but delicate; all of light complexion.

Unknown.

One of the males was of nervous temperament, and died of bilious fever, at 30; the survivor is of temperament similar to father.

Stillborn.

Sex of the stillborn not recollected; the living child, now eight years old, sprightly and well developed.

..

All living, but of only ordinary mental or physical capacities.

..

Have fair hair, light blue eyes, pale doughy skin, and precocious intellect.

..

Well developed and sprightly.

Convulsions 3.

The survivor is neither robust nor bright, but is tolerably healthy.

..

..

All healthy.

Tubercular meningitis.

..

Now healthy and bright, 12 years old, no other pregnancy.

Cholera infantum. Fever.

Both children gave evidence of syphilitic taint during dentition.

..

..

All healthy and bright.

..

Stillborn 1.
Tubercular meningitis 2.
Unknown 1.

Four are normal and healthy.

..

All healthy and bright.

..

All healthy and bright.

..

All healthy and bright.

..

These children are healthy, but eccentric and inefficient.
Sterile.

..

Both bright minds.

CAUSE OF DEATH.

CONDITION OF CHILDREN,
REMARKS, ETC.

..	..	All living and healthy, aged from 26 to 13.
Drowning.	..	Normal.
..	..	All healthy.
..	..	All healthy.
Smallpox.	..	Survivors healthy.
Consumption.	..	The mute lost her hearing at 18 months from measles, and died at 17; survivors healthy.
..	..	Without deformity, but all rather delicate.
..	..	Sterile.
Unknown 1. Drowned 1.	..	The survivor is healthy and normal; the one drowned had heart disease.
Consumption 1. Hydrocephalus 1. Scarlatina.	..	The survivors are all married, one is male in No. 56, Class C. The survivor is feeble in body and mind.
..	..	These children are but slightly scrofulous, and are otherwise bright and active.
Convulsions. "	..	One of the deceased was badly deformed; one of the survivors has chronic enlargement of the tonsils, and slight deafness.
"Sore-throat."	..	The four survivors healthy and sprightly.
..	..	Sterile.
..	..	Sterile.
..	..	Two were deformed, a son with deformed arm, a daughter with curved spine; none entirely equal to parents, who were remarkably endowed, both physically and mentally.
..	..	Sterile.
Unknown.	..	Of the two defective, one has curved spine, and both hear badly; the others are said to be sprightly.

TABLE I.—*Comparative Results of Marriages between parties not pre-*

PARENTS.			
NUMBER OF OBSERVATIONS.	HEALTH, HABITS, ETC.	RESIDENCE.	OCCUPATION.
1	Both healthy. Male was brother to male of No. 592, Class E; other brothers, whose cases are not reported, married without the circle of relationship, having perfect children.	Kentucky.	..
1	Both healthy; male bilious, female sanguine, temperament; in easy circumstances of life. Male was brother to male of No. 13, Class G.	Kentucky.	Farmer.
1	Male, brother to females of Nos. 587 and 588, Class E, has married three times; one wife delicate, the others healthy; of good health, and wealthy; sanguine temperament.	Kentucky.	Farmer.
1	Both good health and habits; male had dark hair, eyes, and skin, bilious temperament; female, blue eyes, fair skin and hair, sanguineo-lymphatic. Male was brother to female of No. 600, Class E.	Kentucky.	Farmer.
10	These couples were taken from ordinary circles of life in and around a small interior village, probably in many instances comfortable farmers.	Tennessee.	..
10	Taken from ordinary circles of life in and around a flourishing city.	Indiana.	..
15	Taken from ordinary circles of life in and around a small town, probably farmers in a majority of instances.	Missouri.	..
10	Taken from ordinary circles of life in and around a village.	Ohio.	..
15	Taken from ordinary circles of life in a flourishing city.	Wisconsin.	..
20	All of these parents are farmers, with two or three exceptions.	New Jersey.	Farmers.
10	All from a country residence, probably farmers.	New York.	Farmers.
10	Taken from ordinary circles of life in and around a village.	Vermont.	..
10	Taken from ordinary circles of life in and around a village.	Vermont.	..
1	Both good health; male had light hair and complexion, blue eyes, at times intemperate, was brother to male of No. 600, Class E; female, red hair, blue eyes, fair skin, good habits.	Kentucky.	Farmers.
10	Taken from ordinary circles of life in and around a small interior village, and probably farmers in a majority of instances; all good livers.	Kentucky.	..
Total 125			

NOTE.—Thirty-one marriages of parties not known to be related or descendants of relations, occurring in and around a small village in Kentucky, produced two hundred and seven children, ninety-eight males, one hundred and nine females. The number dying before maturity not stated. Two of these unions were followed each by thirteen children—the greatest number born to any one marriage; three

viously related or known to be the immediate descendants of Relations.

CHILDREN.													
Number of children.	SEX.		No. defective.	Deaf and dumb.	Blind.	Idiotic.	Insane.	Epileptic.	Scrofulous.	Died young.	SEX.		CONDITION OF CHILDREN, REMARKS, ETC.
	Male.	Female.									Male.	Female.	
6	5	1	All healthy and sprightly.
8	3	5	1	2	1	1	The female who died had curved spine, remainder normal and healthy.
12	Sex not known, all good looking, intelligent, and healthy.
8	4	4	1	1	..	All healthy, intolligont, and well-formed.
83	38	45	23	12	11	All were well-formed; the survivors are healthy, with the exception of one, who is predisposed to consumption.
71	32	39	8	3	5	Not an instance of physical deformity or mental imbecility among them.
111	55	56	20	10	10	
68	40	28	7	Those who survive are, without exception, well-formed and usually well-endowed.
74	42	32	15	8	7	No physical or mental abnormalities among survivors.
143	86	57	12	3	..	5	1	16	Three of the defective have difficult articulation; sex of those who died not reported.
68	37	31	1	..	*1	*1	*1	6	3	3	Survivors well-formed, and of ordinary health.
59	36	22	11	One snrvivor had chorea; his father, a drunkard; remainder normal and healthy.
55	26	29	3	2	..	14	One is doformed from rachitis; some of the survivors rather dull, but none classed as idiots.
6	2	4	All normal and healthy, with bright minds.
65	38	27	1	1	11	4	7	One became insaue; none deformed; one idiotic, referred to early disease. All arrived at puberty, but since two died at puberty.
837	444	380	18	3	1	6	1	3	1	134	42	44	

produced three each, the smallest number resulting from any fruitful union; four were sterile. None of the children were reported to have been born with any defect. All these were instances of first marriage, and the parties lived together through the child-bearing period.
